

## Bees@Schools 2020 Insect Program Report

Thank you very much for participating in Bees@Schools 2020! Of the 170 nests that were returned to us in the fall of 2020, 93 of them were occupied, and all have successful barcoding results below. Click on your school in the table of contents to see all the insect species we found!

## Bees@Schools 2020 Insect Information

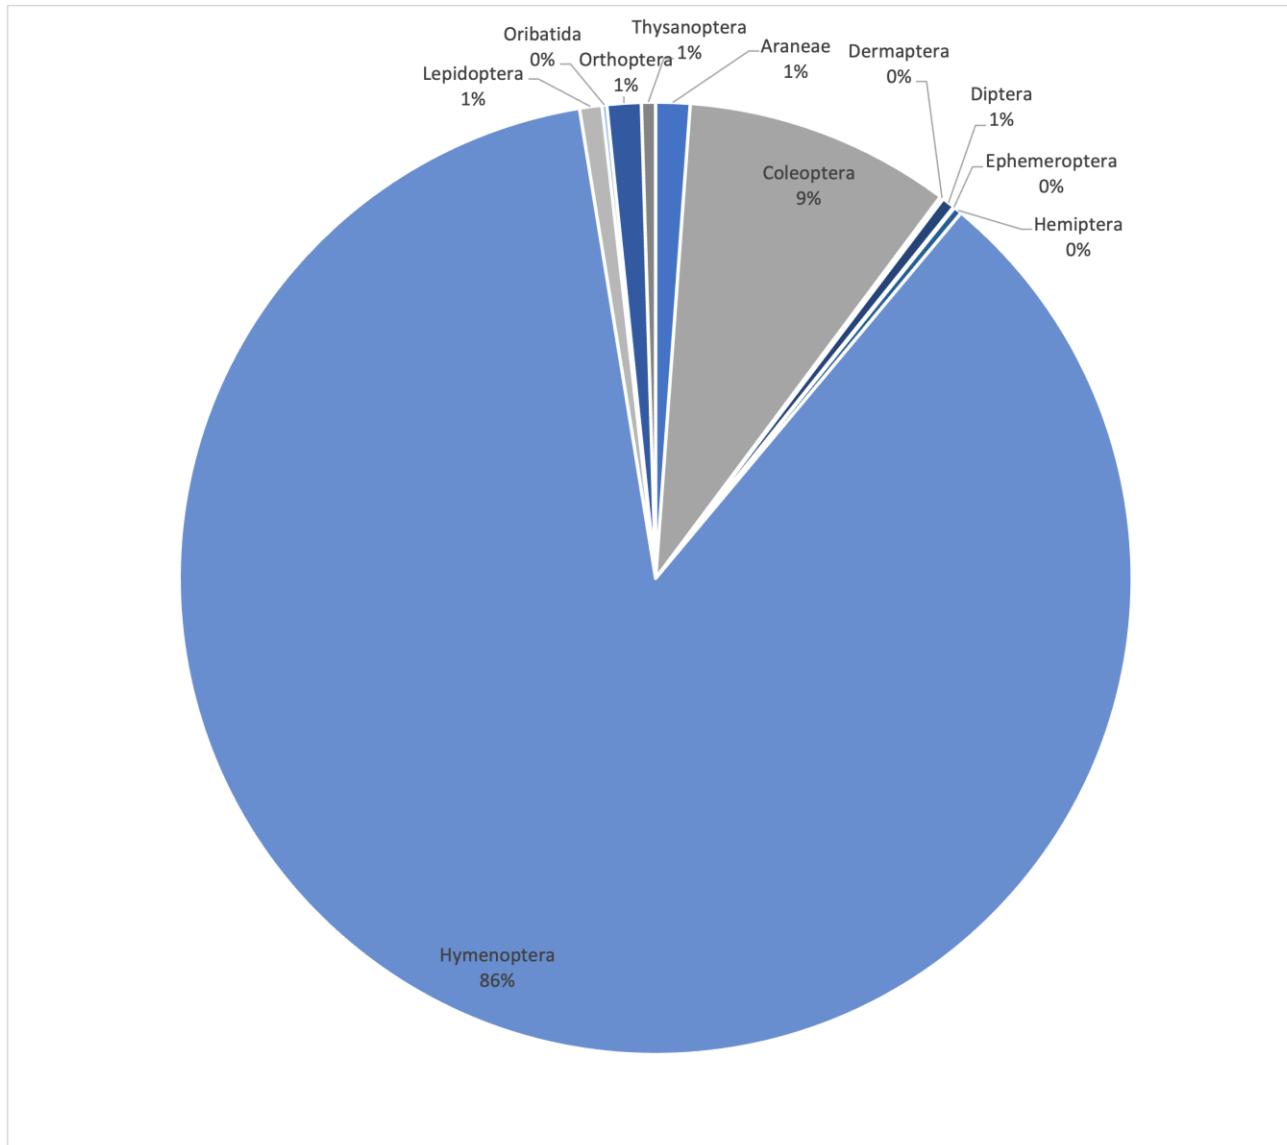

Figure 1: Proportion of total insect identifications made up of each insect order found (out of 2501 occurrences).

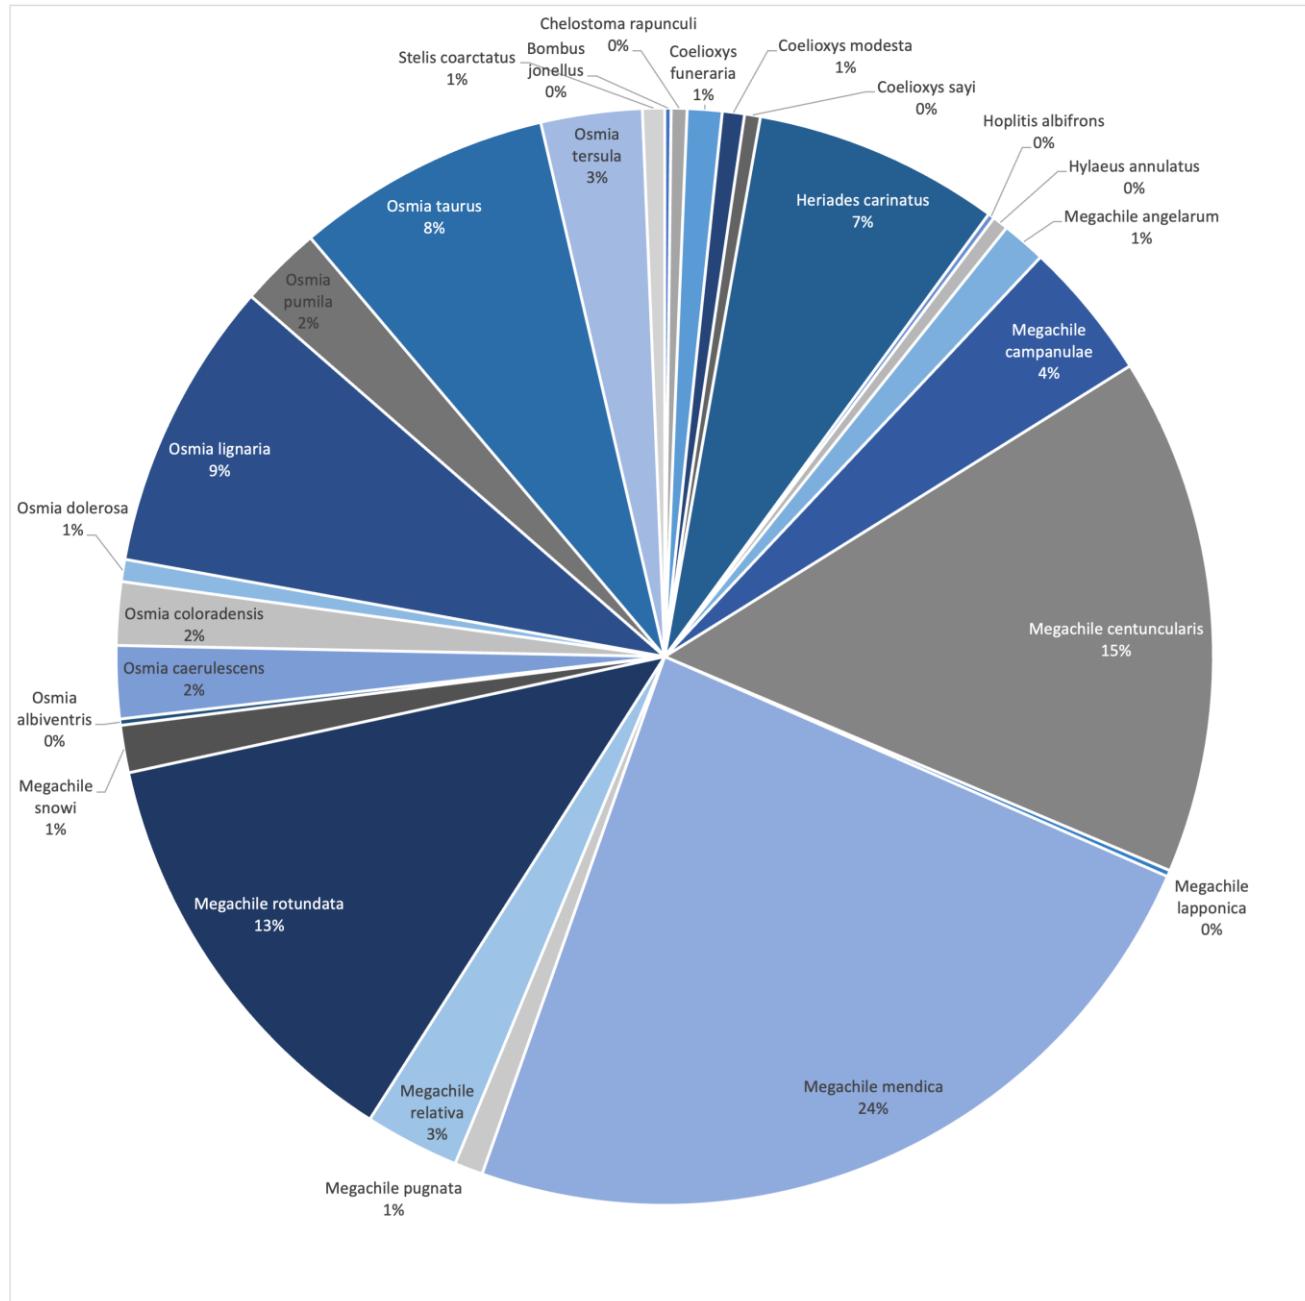

Figure 2: Proportion of total bee identifications made up of each species found (out of 1074 occurrences).

Background information on insect orders:

- **Araneae** and **Oribatida** are not actually insects, but are arthropods commonly known as spiders and mites. Many solitary wasps prey on spiders, explaining why we found so many of them in our nests. Mites would be found incidentally in the nests if they hitch a ride on a flying insect from a flower.
- **Coleoptera** is a largest insect order, comprised of beetles. Many beetles found in the nest boxes were prey for the solitary wasps that used these tubes.
- **Dermaptera** is a small insect order containing earwigs. Earwigs are opportunists and found cozy homes in a few nest boxes.
- **Diptera** is a large order which includes flies. Flies may have a few reasons for being in a nest box. Some may have been prey for wasps, while others might be parasites themselves, laying their eggs in an already built bee home.
- **Ephemeroptera**
- **Hemiptera** is an order referred to as the 'true bugs'. It is most likely that these insects were brought into a nest box as prey for wasps.
- **Hymenoptera** is an order which includes bees, wasps, and ants. These nest boxes are made to target the nesting activities of a select group of solitary bees and wasps called cavity-nesters. Solitary bees and wasps are close relatives, and bees are really just vegetarian wasps. Many of the non-Hymenopteran insects in a nest box are prey for these solitary wasps.
  - Colletidae and Megachilidae are the two families of cavity-nesting bees we have in our nests! These are highlighted in blue!
    - Click the species name for more info and pictures of the bees we found: [\*Coelioxys funeraria\*](#), [\*Coelioxys moesta\*](#), [\*Coelioxys modestus\*](#), [\*Heriades carinatus\*](#), [\*Hylaeus annulatus\*](#), [\*Hylaeus pictipes\*](#), [\*Megachile campanulae\*](#), [\*Megachile centuncularis\*](#), [\*Megachile lapponica\*](#), [\*Megachile mendica\*](#), [\*Megachile pugnata\*](#), [\*Megachile relativa\*](#), [\*Megachile rotundata\*](#), [\*Osmia bicornis bicornis\*](#), [\*Osmia caerulescens\*](#), [\*Osmia coloradensis\*](#), [\*Osmia lignaria\*](#), [\*Osmia pumila\*](#), [\*Osmia taurus\*](#), [\*Stelis vernalis\*](#)
  - Braconidae, Chrysididae, Eulophidae, Ichneumonidae, Pteromalidae, Sapygidae, and Torymidae are parasitic wasps, meaning they lay their eggs on another insect's pre-made nest.
  - Crabronidae, Pompilidae, and Sphecidae are predatory wasps, meaning they hunt insects like caterpillars and small bugs.
  - Vespidae is a large family of wasp, which includes yellowjackets, but the ones found here are likely predators.
- **Lepidoptera** includes the butterflies and moths. Many caterpillars are prey for solitary wasps.
- **Orthoptera** includes grasshoppers, locusts, and crickets. Many such insects are prey for solitary wasps
- **Thysanoptera** is an order of tiny insects called thrips. They are incidentally found in nests.
